

The Mitsubishi Jet Towel & LEED Credentials

Developed in 1998 with the aims of providing real benchmarks for green building design, LEED has become an international standard for building owners wishing to achieve healthy and environmentally sound environments.

By eliminating paper waste and using less electricity than any comparable dryer, the Mitsubishi Jet Towel positively contributes to the LEED certification process of any building.

How is it Green?

- Conserves energy by drying hands in 10 seconds and turning off once hands have left the dryer.
- Uses the least electricity of any high-speed hand dryer.
- Eliminates paper towel consumption in restrooms, reducing the GWP of hand drying by 85%. Removing paper towels eliminates the associated resources, processing chemicals, and transportation as well as reducing waste output. One office building would see a reduction in 1,500 pounds of waste per dryer per year with the Jet Towel.

LEED Credits with the Jet Towel

The Jet Towel helps achieve LEED points in the following categories:

- EA Prerequisite for Minimum Energy Performance
- Credit 1 for Optimized Energy Performance
- EBC MR Credit 7.1 for Solid Waste Management:
Ongoing Consumables
